

BUSINESS PROCESS

5 MAJOR PARTS

- Job Orders
- Scheduling
- Service
- Payment
- Expenses
- Reports

1. Job Orders

Customer (b2b & b2c) reaches out through **calls, walk-ins, messaging platforms**. Service Manager (SM) receives the request usually from their mobile device. If it's a b2b then customer will provide a JO with all the details the SM needs (this needs to be elaborated, what details are there?). Otherwise if b2c, SM asks regarding their concern (This could be either for a **preventive or corrective service**). If it's for a corrective maintenance SM has the choice to check first the unit to provide accurate pricing. If it's for a preventive maintenance SM can provide their fixed pricing. Services can be both. SM will request newer customers for their details like: **name, address, contact, etc**. If it's a regular customer then SM can just reconfirm details. If it's b2b then details should already be provided. If it's a b2c customer then SM will end call or transaction through the mobile device.

If it's b2b SM will confirm received the service request by responding through telegram. (Need to know who creates and how a "**job form**" is created, and what details are in there). After scheduling the service manager will reach out to their regular helpers which should be around 2-3 helpers. SM will check if they are available during that time and input details on their notes.

2. Scheduling

During the service request the SM will schedule appointment. If it's a b2b then a time frame is already provided and SM will just adhere to the time frame by allocating the schedule accordingly. (Need to know how this it's being allocated). SM will usually end the b2c transaction or service call by **checking his own notes for schedules and finding the best appropriate time for the schedule** depending on the load (preventive or corrective). Once it's confirmed by both parties the SM will then **note down the appointment** (what app is being used to note this down). If ever a reschedule is needed the SM will reach out to the customer to reschedule (if it's b2b then through telegram). Then SM will update their notes app for new schedule.

3. Service

The SM will arrive on site according to their schedule together with the team (2-3 helpers) to perform the service. Bringing all the equipment that they need (inventory?). For b2b customers SM and

sometimes the helpers will take photos of the service depending on a **checklist** and using an external app for time tracking (**Time Stamp** app). This is all saved locally in the mobile device of the SM. The branch managers will provide the SM **signed documents** which will need to be submitted for completion(I assume ang branch ang mag print ug provide para ani). On EOD the SM forwards these photos and documents to the admin for submission.

4. Payment (Cash-in)

After the service is done customer makes the payment through cash, or online services (bank, gcash, etc). If it's b2b then payment should be made through** bank **sent from the **contractor billing/accounting team**. For b2c once payment is made by customer the **SM informs the admin EOD** of any payment that has been received by the SM. For b2b admin has visibility of how much they should be paid for the service. Then admin will then input these details on their excel sheet from their laptop to audit the payment for accounts receivable. (Need to know if SOA will be generated for b2c) The admin will then generate a **statement of account(SOA)** to send to the billing/accounting team for b2b (need to know what are the details inside, if possible a picture can be provided and we can discuss what parts are important). Once sent the b/a team will send an invoice through telegram which the admin will save somewhere in their laptop. Afterwards the admin will create an **official receipt (O.R)** indicating that the payment has been received (even if payment hasn't actually been received). **need to know the details of these documents like what is inside them to create the accurate** report. Admin will then monitor the payment everyday if has been received then update their excel indicating that it has been received.

5. Expenses (Cash-out)

Expenses made during the service is being saved and monitored by the service manager through his personal notes, whenever a receipt is unavailable. On EOD the SM provides this to the admin from which the admin will input these details in their excel tracking sheet. This involves also any accounts payable, which the admin will monitor and handle.

6. Reports

Reports are all being manually encoded in **excel** in the order that they are received. These are saved in their files.
